How to compile and run code:

To compile the code, go to the folder with the 3 .java files and the text file, then type:

```
javac *.java
```

To run the program, you will need 3 terminal windows: one for each program

In the first window, type:

```
java Network [portNumber]
```

For example:

```
java Network 4893
```

Then, in the second window, type:

```
java Receiver [url] [portNumber]
```

For example:

```
java Receiver localhost 4893
```

Finally, in the third window, type:

```
java Sender [url] [portNumber] [filename]
```

For example,

```
java Sender localhost 4893 message.txt
```

I tested the code on the CISE machines, so this method should work under that environment.
